

# SCORIFY

AI-Powered Lead Scoring Platform

## 1. Problem Statement

In modern sales environments, businesses receive a large volume of inbound leads from multiple channels — websites, email campaigns, ads, social media, and referrals. However, not all leads are equal. The majority of incoming leads are not ready to purchase, yet sales teams spend significant time pursuing them equally, leading to wasted effort and missed opportunities.

According to industry research, only 27% of leads generated are actually sales-ready, meaning 73% of sales effort is potentially wasted without a proper prioritization system. Traditional approaches rely on fixed manual rules or intuition — methods that fail to scale and miss complex behavioral patterns that signal true buying intent.

The specific problems Scorify addresses:

|                            |                                                                                                     |
|----------------------------|-----------------------------------------------------------------------------------------------------|
| Misallocated Sales Effort  | Sales teams call unqualified leads, wasting time that should be spent on high-intent buyers.        |
| Slow Response to Hot Leads | Ready-to-buy prospects wait too long for follow-up and end up converting with competitors.          |
| No Marketing Attribution   | Businesses cannot identify which campaigns bring quality leads versus just traffic.                 |
| Static Rule-Based Scoring  | Traditional scoring systems use fixed rules that do not adapt to changing buyer behavior over time. |

**Proposed Solution:** Scorify uses machine learning to automatically assign each lead a score from 0 to 100 based on behavioral signals (website visits, email opens, form fills, demo requests) and profile attributes (budget, company size, role, intent signals). The model updates in real time and classifies leads as Hot (80–100), Warm (50–79), or Cold (0–49), triggering automated actions for each category. This ensures sales teams always focus on the right leads at the right time.

## Real-World Scenario

Consider a mid-sized real estate agency receiving 200 new leads every week through their website, digital ads, and walk-ins. Their sales team of 5 people cannot meaningfully follow up with all 200 leads, so they either call everyone poorly or pick randomly.

Bilal, a student, reads one blog post and leaves within 30 seconds. Scorify assigns him a score of 12 out of 100 — Cold — and automatically adds him to an email newsletter. No sales time is spent.

Sara, a family buyer, visits four property pages, downloads a brochure, and returns the next day. Scorify scores her 68 out of 100 — Warm — and a sales rep is assigned to follow up within 24 hours with relevant listings.

Mr. Hassan, an investor, requests a callback, specifies his budget, and asks about three specific properties. Scorify scores him 94 out of 100 — Hot — and the senior rep receives an urgent alert to call within 2 hours.

The result: the sales team focuses entirely on the two leads most likely to convert. Bilal stays in the marketing funnel until he shows more intent. No time is wasted, no hot lead goes cold, and every action is triggered automatically without manual review.

## 2. Dataset

---

Scorify's dataset will be built from real business data collected through direct partnerships with companies currently being approached for collaboration. Rather than relying solely on public datasets, the goal is to train the model on genuine real-world lead data, making the scoring system accurate and grounded in actual business behavior.

**Data Collection Strategy:**

|                                           |                                                                                                                                                                                                                                                                                               |
|-------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Partner Companies (Primary Source)</b> | We are actively in contact with businesses in sectors including real estate, travel & tourism, e-commerce, and education. These companies will share anonymized lead records including behavioral activity, lead profile details, and conversion outcomes (bought / did not buy).             |
| <b>Data Fields Being Collected</b>        | Each lead record will include: lead source (ad, organic, referral), number of website visits, time spent on site, pages visited (especially pricing/contact pages), emails opened, forms submitted, budget mentioned, decision timeline, company size (for B2B), and final conversion status. |

|                                         |                                                                                                                                                                                                                                     |
|-----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Data Privacy &amp; Anonymization</b> | All personal identifiers (names, phone numbers, emails) will be removed before use. Only behavioral and profile attributes relevant to scoring will be retained, in compliance with data sharing agreements with partner companies. |
| <b>Supplementary Public Dataset</b>     | While real data collection is underway, the Kaggle Lead Scoring Dataset (X Education, ~9,000 records) will be used for initial model prototyping and validation to ensure the pipeline is ready before real data arrives.           |

**Expected Dataset Size (from partners):** 500–2,000 lead records per company across 2–3 partner organizations, targeting a combined dataset of 3,000–6,000 real records for model training.

### 3. Scope of the Project

---

The scope of Scorify covers problem definition, data identification, and model design, through to model development, evaluation, and deployment.

#### In Scope

- Build an ML model to score leads from 0 to 100 based on behavioral and profile signals
- Classify leads into Hot (80–100), Warm (50–79), and Cold (0–49) categories
- Collect real lead data through partner company collaborations
- Use the Kaggle Lead Scoring Dataset for initial prototyping and pipeline validation
- Identify key input features: website activity, email engagement, form submissions, budget, and role
- Select and compare ML models: Logistic Regression, Random Forest, and XGBoost
- Define evaluation metrics: Accuracy, Precision, Recall, F1-Score, and AUC-ROC
